- 3-CO2 and FM200 system installation

Our New Project

Al Syam new project will measure the energy savings achieved through home efficiency upgrades. Over the course of the project, Al Syam will conduct energy audits for homes, offices, hospitals, factories, schools, universities ...etc. Al Syam will provide energy-efficiency upgrades and study the impact on electricity consumption

This project will help in improving efficiency and reduce electricity consumption and aims to raise awareness and promote best practice in electricity conservation to help make sure we use electricity as efficiently as possible

Our New Project

Guiding and helping consumers rationalize their energy consumption is one of Al Syam's main objectives

Research shows that electricity consumption use can be reduced with simple energy efficiency upgrades, to evaluate how much the client could save with such upgrades; we will study the actual effects over several months

We will conduct a custom audit of all electrical appliances and installations throughout the client and analyze their electricity consumption data

Our New Project

This will allow us to identify ways to improve each home's energy efficiency and support the recommendations we will make for each client

These changes may include

Replacing lights with CFL/LED bulbs*

Performing AC maintenance

Replacing AC units
(if maintenance does not yield acceptable efficiency gains)

Applying timers for outdoor lighting

Replacing inefficient appliances

Improving window insulation

Optimising AC thermostat settings

Optimising refrigerator thermostat settings

Installing occupancy sensors

Installing timers for water heaters

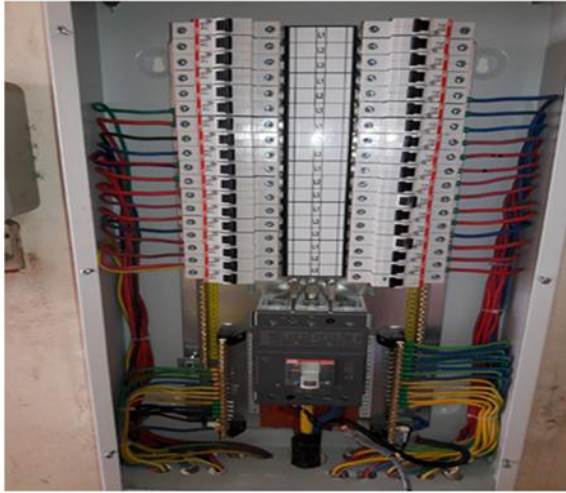

Monitoring :

Once the audit and the installation finish, we will start tracking and analyzing electricity consumption and the effects of the efficiency
